

Francois Gerber

Software Engineer — Data Pipelines & LLM Crawling

ABOUT ME

LLM-powered crawling inside Palantir Foundry, processing up to 5,000 company websites a day.

Dynamic scraping platforms in Python before that, and eight years of .NET full-stack delivery before that.

Senior .NET Full Stack Developer at Ringier South Africa, based in Mauritius.

EDUCATION

Tertiary: MCSD

2013 to 2015 at WW.IT-IQ Training & Solutions

High School: Matric (Grade 12)

2008 to 2012 at High School Lydenburg

WORK EXPERIENCE

Senior .NET Full Stack Developer

2022 to present · Ringier South Africa

Owner of the crawling and processing platform behind Ringier's marketplaces data: user-configurable pipelines that scrape, process and distribute market intelligence in near real time (C#, Python, AWS, Vue, React, Scrapy). Since 2026, an LLM-powered crawling system inside Palantir Foundry — identification, extraction and pagination across up to 5,000 company websites a day, on Foundry Pipelines, Datasets and Workshop applications.

.NET Full Stack Software Developer

From 2015 till 2022 at BlueMonday PTY (LTD)

While working at Blue Monday, I worked on various business solutions for clients and internal tools and systems. I gained experience in various web technologies including Angular, Ionic, Blazor.NET and backend technologies like ASP.NET Web API, WCF and NodeJS.

Student Developer

From 2013 till 2015 at WW.IT-IQ Training & Solutions

While studying, I worked on programs assigned to me by my lecturers and other programs I thought businesses/people could or would like to use, as well as projects commissioned by clients.

CERTIFICATIONS

- MCSD – Microsoft® Certified Solutions Developer – Web Applications, including HTML5, ASP.Net MVC, Windows Azure (Cloud Development)
- MCSD – Microsoft® Certified Solutions Developer – App Builder
- Microsoft® Certified SQL Specialist
- Microsoft® Certified Professional
- Microsoft® Certified Technology Associate – Networking Fundamentals
- Microsoft® Certified Technology Specialist – Accessing Data
- Microsoft® Certified Specialist – C# & HTML5, CSS3 & JavaScript
- Go – The Complete Guide – Udemy
- The Complete Python Developer – Udemy
- The Complete Prompt Engineering for AI Bootcamp (2025) – Udemy

SKILLS

.NET	C#	ASP.NET	Blazor
Python	Go (GoLang)	TypeScript	JavaScript
SQL	MongoDB	ElasticSearch	Redis
Angular	Vue	React	Node.js
Palantir Foundry	Foundry Pipelines & Datasets		
LLM Extraction & Prompting		Web Scraping (Scrapy, Playwright, Puppeteer)	
Distributed Systems	Data Modelling	Docker	CI/CD
AWS	Azure	Linux	Architecture

ENTERPRISE SOLUTIONS

Hades/Olympus

1 Year (2026)

A LLM-powered web crawling solution designed to scrape and extract job listings from company websites for our clients. Leveraging an LLM for identification, extraction, and pagination tasks, the multi-country, multi-client system efficiently processed up to 5,000 websites daily. The architecture was built entirely in Python, utilizing tools within Palantir Foundry, including Pipelines, Datasets, and Workshop Applications.

Artemis/Apollo Web Crawling and Processing

4 Years (2025)

I was responsible for the development and maintenance of the various systems inside the Meta Team. These applications were used to dynamically setup web crawlers, scrape the desired websites and using user generated pipelines, process and distribute the data to the relevant stakeholders in a near realtime manner. Our data was used in every aspect of the Marketplaces landscape inside the various businesses inside Ringier AG.

(iRIS) Refinery Integration Suite

3 Years (2022)

This application is a modernization of all the old legacy applications at the Precious Metals Refinery. The app was built on modern web development technologies with proper relation databases and a micro service architecture. The application is used in every aspect of the refinery processes and makes reporting easier as there were many standalone applications on site in the past and iRIS is one complete platform. The application also integrates with the marketing team in England as well as on site hardware e.g., Scales, scanners, label printers, PLC's, Engravers and more to come.

Source Rewards

1 Year (2020)

I architected, developed and released the Source Rewards application, used by protection services at all major Anglo American sites for the collection of information and payments to informants. The application changed how protection services used to only collect information on a paper based system to a web based system which allows all users easy access to the relevant information as soon as it is collected.

Operational Intelligence Suite

2 Years (2019)

I was responsible for the development and support of the Operational Intelligence Suite, which was released to 12 different sites during the year. The App was built on AngularJS, .Net Web API Service and a MS SQL database. A mine would monitor their environmental and occupational hygiene sensors using the OiS in real time and configure everything using the App. Integration with the sensors include the OSI Soft Pi Historian, Wonderware, ETL's with manual excel data and using a custom email listener. The project received the Health and Safety Software Award of 2018 in the mining industry.

Visual Business

3 Years (2019)

Enterprise Architects use the application to capture all relevant KPI's and their metadata, create relationship trees with the KPI's and implement the KPI's at clients. The data can then be used to generate Power BI reports to present to the Clients. When the metadata of the client needs to be updated, the reports automatically refreshes the data to show progress of the Business in a Visual manner.

Offline Capture

1 Year (2016)

The system is used to capture questionnaires remotely (without an internet connection) and then uploading the information to the server. The app was written using Apache Cordova and JavaScript with Angular JS.
